7 MODELS · 57 MMLU SUBJECTS

Who Flips?

Self- and Cross-Model Counterarguments Reveal Answer Instability in LLMs

One plausible counterargument flips 17.5–97.3% of correct LLM answers, depending on the model.

Flip rates also depend on the subject (**20.9–80.8%**) and on who wrote the argument.

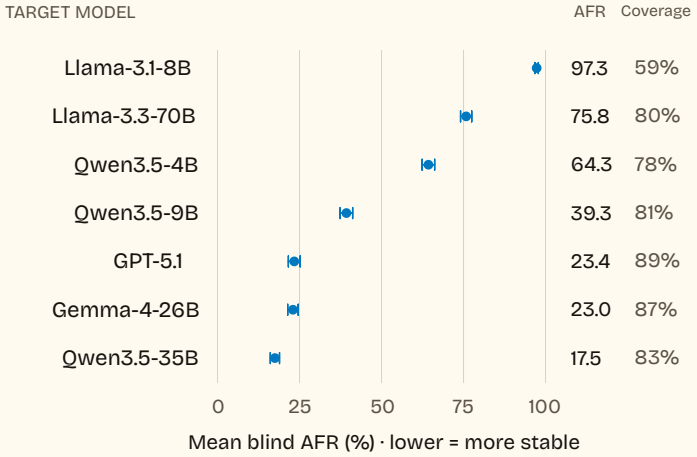

THE EXPERIMENT

Answer flip rate (AFR): share of correct answers that end wrong after the challenge.

KEY FIGURE

Answer stability varies across models.

Choosing the strongest argument across models (**MaxFlip**) raises flip rates by up to **23.6 points**.

Evaluate stability alongside accuracy.
